                                                                                                                                                                                                                                                        . (0
                                                                                     The invention relates to isolated lung tumour-specific proteins and their corresponding cDNA molecules. Lung tumour-specific proteins and their antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer. The invention also relates to a composition useful for stimulating an immune response, and for treating cancer. The lung tumour specific oligonucleotide is useful in gene therapy and for diagnosis, detection and treatment of lung cancer. The present sequence is human T cell epitope related to lung tumour-specific protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Exopolysaccharide; EPS; ESP enzyme; EPS1; EPS2; EPS3; EPS4; EPS5; EPS6; EPS7; EPS8; EPS9; EPS10; EPS11; Lactobacillus helveticus strain LH59; activated D-galactose pyranose; saccharide; beta-glycosyltransferase; undecaprenyl-phosphate-glycosyl-t-phosphate-transferase; alpha-glycosyltransferase; EPS polymerase; glycosyltransferase; phosphofuranose; transporter; food; fermented milk product; yoghurt; cheese; flavour stability; organoleptic property.

In a method to the synthesis of proyection of a certain of the certain of the certain of a certain of a certain of the certain of the certain of a certain of certain of certain of a certain of a certain of a certain of cert
exopolysaccharides (EPS). These enzymes are designated EPS1-EPS11, and are encoded by open reading frames eps1-eps11. The enzymes are isolated from Lactobacillus helveticus strain LH59. The proteins are used in a method for the synthesis of EPS, which includes at least one step
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 recombinant enzymes for biosynthesis of exopolysaccharides having antitumor or probiotic properties or useful in fermented milk
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

AAY4377-87 represent enzymes encoded by the eps operon of Lactobacillus helveticus LH59. The operon contains 11 open reading frames, and encodes enzymes (eps1. eps2, eps3, eps4, eps5, eps6, eps7, eps9, eps9, eps1. eps1. eps2, eps3, eps7, eps5, eps6, eps7, eps9, and eps11) that are involved in the biosynthesis of exopolysaccharides (EPS). The enzymes catalyse the formation of specific intersugar bonds. The enzymes catalyse the formation of specific intersugar bonds. The enzymes catalyse a process that includes at least one step of forming a bond (in alpha or beta anomeric form) between C1, carrying the reducing aldehyde group of an activated D-Galp (galactose in primer. The enzymes are used to produce EPS that have antitumor or primer. The enzymes are used to produce EPS that have antitumor or problotic properties or are used in foodstuffs to improve organoleptic qualities and flavour. When expressed by lactic acid bacteria, EPS impart a free-flowing character and/or a smooth, creamy texture to acidified milk products (yoghurt or cheese).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                phospho-N-acetylmuramoyl-pentapeptide-transferase family; otitis media; bacteraemia; conjunctivitis; sinusitis; pleural empyema; endocarditis;

Phospho-N-acetylmuramoyl-pentapeptide-transferase designated mray. Mray polynucleotides and proteins are useful for diagnosing susceptibility to diseases by detecting mutations or polymorphisms in the mray gene or analysing for the presence of amount of mray protein expressed in a The present sequence represents the ORF protein sequence of an isolated

```
which can be used in treatment to enhance (agonist) or block (antegonist) or antisense sequence) max activity, therefore treating microbial diseases, especially Streptococcus pneumoniae diseases including outliss media, bacteraemia, conjunctivits, pneumonia, sinusitis, pleural empyema, endocarditis and especially meningitis. Epitopes of mray proteins and polynucleotides are useful immunogens (vaccines) for producing anti-mray antibodies for prevention of bacterial infections, and mray polynucleotides for prevention of bacterial infections, therapy) to prevent infections. Wray proteins, polynucleotides and their (ant)agonists can prevent and body implants to prevent bacterial
patient sample. Mray PCR probes are useful for diagnosing diseases, and can characterise the response of the infectious organism to drugs. Mray proteins and polynucleotides are also useful for screening for antaqonists, agonists and drugs against infectious micro-organisms. Mray agonists and antagonists are bacteriostatic and bacteriocidal compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Streptococcus pneumoniae; mraY; transferase; infection; pneumonia; phospho-N-acetylmuramcyl-pentapeptide-transferase family; otitis media; bacteraemia; conjunctivitis; sinusitis; pleural empyema; endocarditis;

proteins are useful for diagnosing susceptibility to diseases by
detecting mutations or polymorphisms in the mray gene or analysing for
the presence of amount of mray protein expressed in a patient sample.
Mray PCR probes are useful for diagnosing diseases, and can characterise
the response of the infectious organism to drugs. Mray proteins and
polymucleotides are also useful for screening for antagonists, agonists
and drugs against infectious micro-organisms. Mray agonists and
antagonists are bacteriostatic and bacteriocidal compounds which can be
sequence) mray activity, therefore treating microbial diseases,
sequence) mray activity, therefore treating microbial diseases,
especially Streptococcus pneumoniae diseases including otitis media,
bacteraemia, conjunctivitis, pneumonia, sinusitis, pleural empyema,
condocarditis and especially meningitis. Epitopes of mray proteins and
polynucleotides are useful immunogens (vaccines) for producing anti-mray
polynucleotides can be used in genetic immunisation (gene therapy) to
prevent infections. Mray proteins, polynucleotides and their
control provent infections. Mray proteins, and
control advession of bacterial to matrix proteins, and
control are assetul for use on wounds and body implants to prevent bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .;

Appression, where too status for the presence of proteins essential for the viability of a bacterial cell wall in samples such as cells, tissues, biological fluids, blood, serum, nose, ear or throat swabs with ligands, and for detecting corresponding target nucleic acid molecules with complementary sequences. The nucleic acids are also useful for determining whether a genomic nucleotide sequence of interest is essential for viability of a bacterial cell or whether it resides within an operon, by integrating an exogeneous nucleotide sequence comprising a portion of an open reading frame of the genomic sequence of interest comprising 200-500 base pairs) into the genomic sequence of interest which confers a selectable phenotype to the cell, and determining cell viability with a selection agent such as chloramphenicol. The nucleic acids and proteins are also useful as vaccines and for treating bacterial infections with gene therapy and antisense therapy. The nucleic acids antibiotic resistant bacterial infections.

Claim 11; SEQ ID NO 11673; 3071pp + Sequence Listing; English.

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -

Rosen CA, Barash SC, Ruben (HUMA-) HUMAN GENOME SCI INC.

WPI; 2001-483426/52. N-PSDB; AAK56861.

amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) colynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to produce the call to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially concern acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-derived cells. AAK64703 concerns and canner metastases of haematopoietic derived cells. AAK64703 concerns cell to proceed to the present invention. AAK84942 to AAK87650 and AAM82169 represent sequences used in the exemplification of the present invention.

The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gyaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other disgnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, reproductive, disorders, wounds, and infectious diseases. AAF16506 to AAF16514 to AAB57303 represent sequences used in the exemplification of the present

                                                                                                                                               This sequence represents the VH5 domain of an anti-CD4 antibody (Ab). This sequence can be used in the method of the invention for treating a subject, where the treatment comprises administration of an antibody which has an Old World monkey (e.g. baboon or macaque) variable region which binds to an antigen (Ag) (or Ag binding portion), and a human constant domain. The method is useful for the treatment of eczema and immuno-modulated diseases and especially rheumatoid arthritis. The recombinant antibodies used are sufficiently different from native monkey antibodies to allow human antigens to raise these antibodies, but similar enough to human antibodies used in therapy in prior art, these antibodies do not antibodies used in therapy in prior art, these antibodies do have longer half-lives and do not have a lack of effector function with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
Improved method for antibody treatment – uses an antibody comprising an Old World monkey variable region and a human constant domain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated human G protein-coupled receptor subfamily. The polypeptide comprises a fully defined sequence of 289 amino acids as given in the specification, or its fragment comprising 10 contiguous amino acids, or an amino acid sequence of an allelic variant or orthologue of the amino acid sequence given in the sequence. The polypeptide is useful for identifying a modulator of a GPCR polypeptide or an an agent that binds too it. The polypeptide is also useful for treating a disease or condition mediated by human proteases. The present sequence is a rat GPCR polypeptide used in comparison studies with the polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                G-protein coupled receptor; ligand binding assay; transmembrane domain; psychotic disorder; schizophrenia; dopamine; cAMP; adenosine; thrombin; muscarinic acetylcholine; adrenergic; endothelin; bombesin; endocrine; rhodopsin; opsin; odorant; cytomegalovirus.
                                                                                                                                                                                                                                                                                                                                                                                                                       Novel human G protein-coupled receptor polypeptide that is related to MAS proto-oncogene receptor subfamily, useful as model and target for developing human therapeutic agent -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

proteins selected from CAMP, adenosine, muscarinic acetylcholine, adrenergic thrombin, endothelin, bombesin, endocrine, rhodopsin, opsin, addrant, cytomegaloviral and other G-protein coupled receptors. The receptor proteins were used to design polypeptides, pref. based on the transmembrane domains, for use in G-protein coupled receptor ligand blinding assays. The polypeptide fragments retain biological activity such as binding agent ligand or modulating GPR ligand binding to a GPR (see AAR48759-R48758, AAR50569-R50807 and AAR89189-R89195 for examples of polypeptide fragments can be used in compositions for treating subjects suffering from a pathology related to a GPR abnormality e.g. a psychotic disorder such as schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Proteins AAR48685-R48758 represent a range of G-protein coupled receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                G-protein coupled receptor; ligand binding assay; transmembrane domain; schizophrenia; dopamine; cAMP; adenosine; thrombin; adrenergic; opsin; muscarinic acetylcholine; endothelin; bombesin; endocrine; rhodopsin; odorant; cytomegalovirus; serotonergic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                    Proteins AAW02657-W02730 represent a range of G-protein coupled receptor defensely. Aromain, endothelin, bombesin, endocrine, rhodopsin, opsin, odorant, cytomegaloviral and other GPR proteins. The receptor proteins were used to design polypeptides, pref. based on the transmembrane domains, for use in G-protein coupled receptor ligand binding assays. The polypeptide fragments retain biological activity such as binding a GPR 14gand or modulating GPR 11gand binding to a GPR (see AAW02247-W0299) for examples of polypeptide fragments). The polypeptide fragments can be used in compositions for treating subjects suffering such as schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                signal processing; female reproductive tissue; infertility; cardiovascular disease; coronary heart disease; heart attack; stroke; inflammatory disorder; metabolic disorder; utenus; placenta; ovary; prostate; reproductive disorder; pain; cancer; CNS disorder; ovary; prostate; reproductive disorder; pain; cancer; CNS disorder; contral nervous system disorder; schizophrenia; episodic paroxysmal anxiety; EPA, obsessive compulsive disorder; CDD; Parkinson's disease; multiple sclerosis; Alzheimer's disease; dementia; Huntingdon's disease; anorexia; kidney disease; renal failure; obesity; astrointestinal disorder; irritable bowel syndrome; IBS; diarrhoea; allergy; arthritis; sepsis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 G-protein coupled, receptor; IGPcR18; cardiovascular system disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                 New dopamine receptor peptide - useful as antipsychotic agent, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New human G protein-coupled receptor protein, IGPCR18, useful for diagnosis, prevention, amelioration or treatment of pain, cancer,

in female reproductive tissues, such as infertility, cardiovascular diseases such as coronary heart disease, heart attack and stroke, conflammentry disorders and metabolic disorders linked to reproductive tissues like uterus, placenta, ovary and prostate, reproductive disorders, pain, cancer, central nervous system disorders such as schizophrenia, episodic paroxysmal anxiety (EPA) disorders such as schizophrenia, episodic paroxysmal anxiety (EPA) disorders such as schizophrenia, episodic paroxysmal anxiety (EPA) disorders such as schizophrenia, alsease, dementia, Huntington's disease, anorexia, kidney diseases such as renal failure, obesity, gastrointestinal cdisorders such as renal failure, observity, gastrointestinal cdisorders such as renal failure, observity, gastrointestinal cdisorders and conditions of delayed gastric emptying, osteoporosis, infections such as paramed in for the disorders and conditions of delayed gastric emptying, osteoporosis, asthma, allergy, arthritis, and sepsis. (I) is useful for the production of other cellular gene products involved in regulating IGPORIB, and as pharmaceutical reagents. (II) is useful for mapping the location of the gene to the chromosome, and to detect abnormalities involving IGPORIB gene structure. This continual is the anino acid sequence of the novel human of protein coupled receptor, and the anino acid sequence of the novel human of protein coupled receptor, and an acid sequence of the novel human of protein coupled receptor, and an acid sequence of the novel human of ac
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                colon; small intestine; stomach; mammary gland; prostate; testis; psychiatric disorder; central nervous system disorder; schizophrenia; episodic and paroxysmal anxiety disorder; Parkinson's disease; multiple sclerosis; Alzheimer's disease; cardiovascular disease; nearline; angina pectoris; kidney disease; dyslipidaemias; obesity; emesis; gastrointestinal disorder; inflammatory bowel disease; diabetes; osteoporosis; inflammation; infection; human immunodeficiency virus; HIV; cancer; immune disorder; urinary retention; asthma; allergy; arthritis; benign prostatic hypertrophy; endotoxin shock; sepsis; gene therapy; gynaecological disorder; vaccine; human.
                                                                                                                                      The invention describes a novel human G protein-coupled receptor (GPCR) protein, IGPCR18 (1). (1), the polynucleotide (II), agonists and antagonists of (I)/(II) are useful for the diagnosis and treatment of cardiovascular system disorders, the detection of mutant or inappropriately expressed forms of IGPCR18, and for drug screening. (I) is useful in treatment of diseases associated with signal processing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       IGS43; G-protein coupled receptor; GPCR; uterus; lung; trachea;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to IGS43 G-protein coupled receptor (GPCR) and the polynucleotide encoding it. The IGS43 polypeptide, polynucleotide, agonist, antegonist or antibody is useful for treating dysfunctions or agonist, antegonist or antibody is useful for treating dysfunctions or intestine, stomach, mammary gland, prostate, testis, central nervous system, cerebellum and spinal cord. The polypeptide is useful as vaccine for inducing immunological response in a mammal, for treating psychiatric and central nervous system disorders including schizophrenia, episodic and paroxysmal anxiety disorders e.g. obsessive compulsive disorder, bipolar disorder, parkinson's disease, general anxiety disorder, bipolar disorder, parkinson's disease, general cancier, bipolar disorder, parkinson's disease, dementia, severe mental retardation, Huntington's disease, disease, danentia, severe mental retardation, autington's disease, disease, antiem, edition, dependency/craving, sleep disorder, epilepsy, migraine, attention deficit/hyperactivity disorder, cardiovascular diseases including heart failure, angina pectoris, subarchnoid haemornhage, cerebral ischaemia, cerebral infarction, phyertension, thrombosis, arterioscalerosis, cerebral infarction, errobral infarction, disease, kidney disease, dysliphdaemias, obesity, emesis, gastrointestinal disease, diabetic correction, critical propers, including disease, diabetic including critical propers, including critical disease, diabetic including critical propers, and disease, diabetic including critical disease, diabetic disease, and disease, diabetic including critical disease, diabetic disease, and disease, diabetic disease, and disease diabetic disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    gastroparesis and diabetes, ulcers, diarrhoea, osteoporosis, infertions including bacterial, fungal, protozoan and viral infections, particularly human immunodeficiency virus (HIV)-1 or HIV-2 infections, particularly human immunodeficiency virus (HIV)-1 or HIV-2 infections, particularly human immunodeficiency virus (HIV)-1 or HIV-2 infections, pain, cancers, chemotherapy induced injury, tumour invasion, immune disorders, urinary retention, asthma, allergias, arthritis, benign prostatic hypertrophy, endotoxin shock, sepsis, complications of diabetes mellitus, and gynaecological disorders. The polypeptide and polynuclectide of the invention are also useful as research reagents and materials for discovery of treatments and diagnostics to animal and human diseases. The polynuclectide is also useful for chromosome identification. The polynuclectide is also useful for assessing the binding of small molecule substrates and ligands in cells, cell-free preparations, chemical libraries and natural product mixtures. The present sequence is human 16843 GPCR.
                                                                                                                                                                                                                                                                                          Novel G-protein coupled receptor, termed IGS43 polypeptide and nucleic acid encoding the polypeptide, useful for treating disorders of uterus, kidney, lung, colon, stomach, mammary gland, prostate and testis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

G protein coupled receptor (GCR) proteins can be used to identify ligands which act as antagonists of GCR/ligand binding. Such ligands can be used for promoting or inhibiting physiological responses such as liberation of arachidonic acid, acetylcholine and endocellular calcium, endocellular cyclic AMP production, production of inositol, changes in cell membrane potential, phosphorylation of endocellular protein and cell promulgation. The GCR products can also be used for the detection of ligands and in the production of antibodies and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

GENERAL INFORMATION:

APPLICANT: Lynn Doucette-Stamm et al

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCOCCUS

TITLE OF INVENTION: EPIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: GTC-007

CURRENT APPLICATION NUMBER: US/09/134,001C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ; LOCATION: (6) ... hypothetical protein all4113 [imported] - Nostoc sp. (strain PCC 7120)
C; Species: Nostoc sp.
A; Note in Strain PCC 7120 is a synonym of Anabaena sp. strain PCC 7120
C; Date: 14-Dec-2001 #sequence_revision 14-Dec-2001 #text_change 30-Jun-2002
C; Accession: AB2320
R; Raneko, T.; Nakamura, Y.; Wolk, C.P.; Kuritz, T.; Sasamoto, S.; Watanabe, A.; Irin Nakazaki, N.; Shimpo, S.; Sugimoto, M.; Takazawa, M.; Yamada, M.; Yasuda, M.; Taba DNA Res. 8, 205-213, 2001
A; Title: Complete Genomic Sequence of the Filamentous Nitrogen-fixing Cyanobacterium A; Reference number: AB1807; MUID:21595285; PMID:11759840
A; Status: preliminary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A; Molecule type: DNA

"Sucrose synthase of Arabidopsis: genomic cloning and sequence characterization."; 11-134(1992).
-! FUNCTION: SUCROSE-CLEAVING ENZYME THAT PROVIDES UDP-GLUCOSE AND FRUCTOSE FOR VARIOUS METABOLIC PATHWAYS.
-! CATALYTIC ACTIVITY: UDP-91ucose + D-fructose = UDP + sucrose.
-! INDUCTION: BY ANAEROBIC STRESS.
-! SIMILARITY: BELONGS TO THE GLYCOSYLTRANSFERASE FAMILY 1. PLANT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

Proc. Natl. Acad. Sci. U.S.A. 88:8754-8758(1991).
-! FUNCTION: CATALXZES THE PRODUCTION OF GABA.
-! CATALXZES THE PRODUCTION OF GABA.
-! CATALXZEC ACTIVITY: L-glutamate = 4-aminobutanoate + CO(2).
-! COPACTOR: PYRIDOXAL PHOSPHATE.
-! SUMILY: HOMODIMER.
-! SIMILARITY: BELONGS TO GROUP II DECARBOXYLASES (DDC, GAD, HDC AND TYRDC):
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

-!- FUNCTION: CYTOCHROME C OXIDASE IS THE COMPONENT OF THE RESPIRATORY
CHAIN THAT CATALYZES THE REDUCTION OF OXYGEN TO WATER. SUBNNITS 1-
3 FORM THE FUNCTIONAL CORE OF THE ENZYME COMPLEX. CO I IS THE
CATALYTIC SUBUNIT OF THE ENXYME. ELECTRONS ORIGINATING IN
CYTOCHROME C ARE TRANSFERRED VIA THE COPPER A CENTER FORMED BY HEME A3
AND GOPPER B (BY SIMILARITY).
-!- CATALYTIC ACTIVITY: 4 FERROCYTOCHROME C + O(2) = 4 FERRICYTOCHROME
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   INNER MEMBRANE (BY SIMILARITY).

-1-FUNCTION: CYTOCHROME C OXIDASE IS THE COMPONENT OF THE RESPIRATORY CHAIN THAT CATALYZES THE REDOCTION OF OXYGEN TO WATER. SUBUNITS 1-3 FORM THE FUNCTIONAL CORE OF THE ENZYME COMPLEX. CO I IS THE CATALYZIC SUBUNIT OF THE ENZYME. ELECTRONS ORIGINATING IN CYTOCHROME C ARE TRANSFERRED VIA THE COPPER A CENTER OF SUBUNIT 2 AND HEME A OF SUBUNIT 1 TO THE BIMETALLIC CENTER FORMED BY HEME A3 AND COPPER B (BY SIMILARITY).

-1-CATALYZIC ACTIVITY: 4 FERROCYTOCHROME C + O(2) = 4 FERRICYTOCHROME
